Cover: The image shows keratinocytes forming protrusions and beginning to migrate off micro-patterned collagen islands. Cells were seeded onto the patterns, then induced to migrate by activating the surrounding non-adhesive polymer surface with collagen-mimetic peptides. The F-actin cytoskeleton is stained with phalloidin (green) and the nuclei are labelled with DAPI (blue). See article by F. V. Almeida et al. (pp. 4475–4486).
