

NOTE.

Arhynchus hemignathi.

IN the 39th Volume (New Series) of this Journal, p. 207, I described a new Acanthocephalon taken from inside the skin in the neighbourhood of the anus of a Sandwich Island bird, *Hemignathus procerus*. I suggested the name of *Arhynchus* for this form, since its chief characteristic is the absence of a proboscis. Recently both Professor C. Wardell Styles and Professor A. Hassall have pointed out that this name is preoccupied, having been used by Dujean in 1834 for a beetle. I therefore now suggest the name of *Apororhynchus* for the new genus which I described in 1896.
